ASSIGNMENT -2

- 1). What are the data types in Python? Explain.

 (A). The data types defined in the python are:
 - 1. Numbers
 - 2. String
 - 3. List
 - 4. Juple
 - 5. Numbers:
 - 5 Dictionary

1 Numbers:

Number store numberic value

194thon supports 4 types of numeric data:

(1) int (signed integers like 70,2,39 etc.)

- values like 9392308 etc)
 - tiked 9.3, 8.305 etc).
- Gur complex (complex numbers like 3+191)

2. String :-

The string can be defined as the sequence of characters represented in the quotation marks. In python we use single double or wiple quotes to define a string.

3. dist 1-List are similar to armays in c. However, the list contain data of different types the items stored in the list are seperated with a comma and enclosed within the square bracketscj. we can use sice (;) operators to access the data of the list Eg - 1 = [1, "hi", "python", 2] print (1(3:1); output 2 4. Juple -A Juple is similar to the list in many ways. Like list Supre also contain the collection of the items of different data types the items of tuple are seperated with a commac, and enclosed in the paranthesis ()

print (t [1:]);

olp: ('python', 2)

Dictionary is an ordered set of a key-value pair of items of is like an associative array skey can hold any primitive data type whereas value is an arbitary python object.

eg: d= {1: "jimmy", 2: "Alex", 3: john };

point(" 18t name is "+d[i]);

Briefly explain history of Python?

python is a widely used general - purpose, high-level programming language of was intially designed by guidovan Rossum in 1991 and developed by python software foundation of was mainly developed for emphasis on code readability and its syntax allows programmers to express concept in fewer lines of code.

9n the late 1980's history was about to written. It was that time when working on python started. Soon after that, guido van Rossum began doing its application based work in dec of 1989 by at centrum. wisk unde and enformatica (cw1) which is situated in Netherland. It was started first as a hobby project because he was looking for an interesting project because he was looking to keep him occupied during christmas. The programming language which python is said to have succeeded in ABC programming language, which had the interfacing with the Amoeba operating system and had the feature of exception handling. He had almeady helped to create ABC earlier in his career and he had seen some issues with Atac but liked most of the features. After that what he did as weally very deven the had taken the syntax of ABC, and of its good features. It came with a lot of complaints too, so he fixed those issues completely and hold created a good scripting language which had removed an the flaus. The inspiration for the name came from BBCs TV show-"monty" python's flying circus' as he was

(30)

a big fan of the TV show and also he wanted a showt, unique and slightly mysterious name for his intention, and hence hename it python!

The language was finally weleased in 1991. When it was released, it used a lot fewer codes to express the concepts when we compare it with java, c. and c++. Its design philosophy was quite good too. Its main objective is too provide code readability and advanced developer productivity. When it was released it had more than enough capability to provide classes with Inheritance, several come class types exeception handling and functions.

3). Explain the operators in Python?

A). 111 Withmetic operators:

shese are used to perform another etic operation between two operations. It includes addition(+), subtraction(-), multiplication(*), divide(1), remainder(%), floor division(11) and exponent (**)

the comparison operatory such signs in the

These are used to compare the value of the two operands and returns boolean true or false accordingly. The comparison operators are

55 , 15 , 45 , 75 , 75 , 6

Gin cassigment operators

There are used to assign the value of the night expression to the left operand.

eg of cassignment operators,

= , += , -= , *= , %= , * * = , //= , mod al politico de

Civi Bit wise operators.

The Bitwise operators perform bit by bit operation on the values of two operands

Binary and (1) Binary exor (1) leftshift (<<)
Binary or (11) negation (12) Right shift (>>)

(v) Logical operators:

These are used primarry in the expression evaluation to make a decision. Python supports and, or, not logical operators.

(vi). Membewship operations:-10 phones where the

These are used to check the membership of value inside a python of the value is present in data structure, then the resulting value is true otherwise it returnstalse

* in and not in one membership operators.

(vin). Identity operators:

is - 8t is evaluated to be true if the reference present at both side point to the same object

is not - et is evaluated to be true if the reference present at both side do not point to the same object.

- 4). Explain the features of python.
- Python is easy to learn and use st is developed friendly and high level programming language
 - 2) expressive language

 9t means, that is more understandable and weadable
 - 31. Intempreted language

 Intempreter executes the code line by line at a time.

 This makes debugging easy and thus suitable for beginnors.
 - 40. cross-platform language
 At can run equally on different platforms such as windows, linux, unix etc. so we can say python is a portable language.
 - St is freely available at afficial web address.

 Source code is also available et is open source.
 - 6). Object oriented language

 at supports object oriented language and concepts

 of classes and objects come into existence.
 - be used to compile the code and thus it can be used further in our python code.

Seanned with CamScanner

B) Large standard library

Python has large and broad library and provides wich set of module and functions for rapid.

a) aus programming support
graphical user interface can be developed using
python.

10). Integrated

8t can be easily integrated with languages like c, c++, java etc.

Justify why python is interpreted language?

Python is an interacted interpreted language because unlike c/c++ etc, python is an interpreted object oriented programming language. By enterpreted it is meant that each time a program is wen the interpreter checks through the code for environs and then interprets the instructions into machine readable byte code. The can easily integrated python with other languages like c,c++ etc. There is no need to compile python code this makes it easien to debug into an immediate form called p byte code.
